Title	SPSS Analysis for Predicting the Occupational Health and Safety of Sawmill Workers in the Wood Processing Industries in Kerala, India
Source type	Paper
Link / File	https://link.springer.com/article/10.1007/s43621-025-01440-1
Craft applicability	Wood (Indian wood-processing machinery; sanding/machine-noise relevant to Udayagiri's powered stages)
Primary Why-theme	8. Noise (with secondary link to Dust)
Process stage	Piercing/drilling (electric drill) and machine-assisted surface refinement
Questions answered / generated	Why do powered wood-processing machines (drilling, sanding) pose a noise-induced hearing loss risk? What noise levels are typical at Indian wood-processing workstations?
Evidence level	E3 (direct scientific evidence, on-site dBA measurement and audiometry in an Indian wood-processing setting)
Relevance note	Measures actual machine noise levels and audiometric hearing outcomes among Indian wood-processing workers using drilling and sanding equipment comparable to Udayagiri's electric drill and paper-finishing machine, directly addressing the report's flagged gap that no local noise measurement exists.
