Title	Mechanical Properties of Bamboo Through Measurement of Culm Physical Properties for Composite Fabrication of Structural Concrete Reinforcement
Source type	Paper (open access)
Link / File	https://www.researchgate.net/publication/331066032
Craft applicability	Bamboo (root and culm density affecting carving difficulty)
Primary Why-theme	6. Tools and Tool-Material Interaction
Process stage	Sub-step 1.1: Selection of Raw Material; all carving stages
Questions answered	Why does denser, more mature bamboo root require greater carving force and different chisel handling than less dense material?
Evidence level	E3
Relevance note	Demonstrates that bamboo's specific density is directly correlated with its mechanical strength properties, supporting the report's own maturity-selection criteria (denser, heavier roots preferred) and explaining why mature bamboo root demands more carving force.
