| Title | Exploring the Role of Task on Kinematic Variability and Assessing Consistency in Individual Responses Across Repetitive Manual Tasks |
| Source type | Paper |
| Link / File | https://www.researchgate.net/publication/363545397 |
| Craft applicability | Bamboo (fine detail carving of eyes — described as the most critical stage) |
| Primary Why-theme | 10. Quality (distinct from Failure) |
| Process stage | Sub-step 3.1: Detail Carving (Fine Work) |
| Questions answered | Why is carving the eyes described as the most critical stage, and why does hand-controlled precision carving show natural variability between pieces? |
| Evidence level | E3 |
| Relevance note | Confirms motor variability is an inherent, measurable feature of human repetitive manual precision tasks, providing a scientific basis for why the report singles out eye-carving as the most critical and control-demanding stage of the entire process. |
