Title	Risk Factors Associated with Work-Related Musculoskeletal Disorders Among Floor-Sitting Precision Handicraft Workers
Source type	Paper
Link / File	DOI: 10.1007/s00420-021-01817-5
Craft applicability	Wood (Indian handicraft precision-work posture; applicable across floor-seated craft trades)
Primary Why-theme	7. Posture, Grip and Body Mechanics
Process stage	Rough/fine carving (visually demanding, sustained near-body handwork)
Questions answered / generated	Why does prolonged, close, floor-seated carving posture increase risk to the neck, back and knees? Why do continuous work without breaks and sustained awkward posture increase MSD risk?
Evidence level	E3 (direct scientific evidence, occupational cross-sectional study using RULA/REBA and Nordic questionnaire on Indian precision handicraft workers)
Relevance note	Confirms high MSD prevalence (neck 61.6%, lower back 74.8%, knee 54.7%) among floor-sitting Indian precision handicraft workers, and identifies sustained awkward posture, prolonged hours, and lack of breaks as key risk factors — directly applicable to the close, seated hand-carving posture documented for Udayagiri artisans.
