Title	Wood Dust Particle and Mass Concentrations and Filtration Efficiency in Sanding of Wood Materials
Source type	Paper
Link / File	https://www.researchgate.net/publication/23640758
Craft applicability	Wood (tropical hardwood species — relevant to teak, jackfruit used in Kallakurichi)
Primary Why-theme	8. Dust and Respiratory Exposure
Process stage	Proposed mechanization (rotary tools, angle grinder discs)
Questions answered	Why would introducing rotary/grinding power tools increase fine and respirable dust exposure compared to hand tools?
Evidence level	E3
Relevance note	Shows that denser tropical hardwoods generate a higher proportion of fine, respirable dust particles (PM10, PM2.5, PM1) during power sanding/grinding, indicating that the report's proposed mechanization tools (angle grinder, rotary tools) would introduce a new dust exposure risk not present in the current hand-tool process.
