Title	Risk Factors Associated with Work-Related Musculoskeletal Disorders Among Floor-Sitting Precision Handicraft Workers
Source type	Paper
Link / File	DOI: 10.1007/s00420-021-01817-5
Craft applicability	Wood (Kallakurichi murti carving; floor-based work on small sculptures)
Primary Why-theme	7. Posture, Grip and Body Mechanics
Process stage	Outline cutting through Nice finishing (all stages involving small pieces)
Questions answered	Why does prolonged forward bending while working on small wood pieces (below ~2 feet) strain the back, neck and shoulders?
Evidence level	E3
Relevance note	Indian occupational study of 334 floor-seated precision handicraft workers found high prevalence of neck, back and knee MSD symptoms linked to sustained awkward posture and lack of breaks, supporting the report's flagged challenge of posture-related discomfort on smaller carvings.
