Title	Risk Factors Associated with Work-Related Musculoskeletal Disorders Among Floor-Sitting Precision Handicraft Workers
Source type	Paper
Link / File	DOI: 10.1007/s00420-021-01817-5
Craft applicability	Wood (Khatamband floor-based cutting and overhead ceiling installation)
Primary Why-theme	7. Posture, Grip and Body Mechanics
Process stage	Component cutting (floor-based) and on-site installation (overhead)
Questions answered	Why does prolonged floor sitting during fine cutting and overhead reaching during installation cause musculoskeletal stress in the back, shoulders and wrists?
Evidence level	E3
Relevance note	Indian occupational study of floor-seated precision handicraft workers found high prevalence of neck, back and knee MSD symptoms linked to sustained awkward posture, directly supporting the report's own statement that floor sitting and overhead installation lead to musculoskeletal stress requiring ergonomic workbenches.
