Title	Assessment of Dust Emission and Working Conditions in the Bamboo and Wooden Furniture Industries in Malaysia
Source type	Paper (open access)
Link / File	https://bioresources.cnr.ncsu.edu/resources/assessment-of-dust-emission-and-working-conditions-in-the-bamboo-and-wooden-furniture-industries-in-malaysia/
Craft applicability	Bamboo (directly measures bamboo-specific dust, not just wood dust)
Primary Why-theme	8. Dust and Respiratory Exposure
Process stage	Sub-step 3.3: Sanding (Smoothing Stage)
Questions answered	Why does the sanding stage generate the highest dust emission and respiratory risk among bamboo craft workers?
Evidence level	E3
Relevance note	This bamboo-industry-specific study found sanding operations produced the highest dust emission and associated respiratory ailments among workers, directly matching the report's two-stage sandpaper process (150 grit then 320 grit) as a key dust-generating step.
