Title	Generation Rate and Particle Size Distribution of Wood Dust by Handheld Sanding Operation
Source type	Paper
Link / File	DOI: 10.1539/joh.16-0136-BR
Craft applicability	Bamboo (progressive 150 and 320 grit hand sanding)
Primary Why-theme	8. Dust and Respiratory Exposure
Process stage	Sub-step 3.3: Sanding (Smoothing Stage)
Questions answered	Why does the choice of sandpaper grit (coarse 150 vs fine 320) affect the amount and particle size of dust generated during finishing?
Evidence level	E3
Relevance note	Found that coarser sandpaper grits generate significantly more dust than finer grits, directly relevant to the report's two-stage sanding process moving from 150 grit (roughness removal) to 320 grit (smooth finishing).
