Title	The Decay Resistance and Hyphae Penetration of Bamboo Gigantochloa scortechinii Decayed by White and Brown Rot Fungi
Source type	Paper
Link / File	https://onlinelibrary.wiley.com/doi/10.1155/2012/572903
Craft applicability	Bamboo (maturity selection — minimum 3-year-old roots required)
Primary Why-theme	10. Failure, Repair and Quality
Process stage	Sub-step 1.1: Selection of Raw Material
Questions answered	Why is immature bamboo more prone to cracking, decay and insect damage, making artisans avoid it in favor of mature roots?
Evidence level	E3
Relevance note	Found that decay resistance to fungal rot increases significantly with bamboo age due to higher lignin, silica content and density in older culms, directly supporting the report's requirement that only mature bamboo root (minimum 3 years) be selected to avoid cracking, decay or insect damage.
