Title	Assessment of Low-Cost Intervention (Foam Rubber) Among Wood Carvers Exposed to Hand-Arm Vibration and Noise
Source type	Paper
Link / File	https://www.researchgate.net/publication/333161422
Craft applicability	Wood (Indian handicraft wood-carving sector; likely comparable for bamboo carving)
Primary Why-theme	9. Vibration (with secondary link to Noise)
Process stage	Rough carving / primary shaping (hand-tool use)
Questions answered / generated	Why does prolonged hand-tool carving expose artisans to hand-arm vibration and high noise levels? Why might a damping handle intervention reduce this exposure?
Evidence level	E3 (direct scientific evidence, field-measured exposure data from Indian wood carvers)
Relevance note	Directly measures HAV and noise exposure (mean Lex,8h of 93.17 dB(A), exceeding safe limits) among Indian wood carvers using hand carving tools, and tests a low-cost foam-rubber handle intervention showing ~20% vibration reduction — closely matching the *baria*/*ulli* hand-tool use documented for Udayagiri artisans.
