Title	Effects of Mixed Hardwoods Dust on Respiratory Function and Blood Immunoglobulin Levels in Wood Workers
Source type	Paper (open access)
Link	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10884841/
Craft applicability	Wood (tropical hardwood — directly matches ebony/rosewood/sandalwood dust profile)
Primary Why-theme	8. Dust and Respiratory Exposure
Process stage	Phase II & III: Shaping, filing, sanding
Questions answered	Why does dense tropical hardwood dust pose a greater respiratory risk than ordinary sawdust?
Evidence level	E3
Relevance note	Measured, significant reduction in lung function (VC, FEV1, PEFR) and elevated IgE/IgG in workers exposed to mixed tropical hardwood dust — directly relevant since Delhi's material palette (ebony, sandalwood, red sandalwood) is exactly this category of wood.
