Title	Improvement of Termite Resistance, Dimensional Stability and Mechanical Properties of Pine Wood by Paraffin Impregnation
Source type	Paper
Link / File	https://link.springer.com/article/10.1007/s00107-014-0823-7
Craft applicability	Wood (moisture-prone species — Noni, Albizia lebbeck, teak used in Kallakurichi)
Primary Why-theme	10. Failure, Repair and Quality
Process stage	Material augmentation (post-carving preservation treatment)
Questions answered	Why does paraffin wax impregnation improve a wood object's resistance to termites and dimensional instability?
Evidence level	E3
Relevance note	Directly demonstrates that paraffin-impregnated wood shows improved equilibrium moisture content, dimensional stability, density, bending strength, and termite resistance compared to untreated wood, supporting the report's proposal to use a paraffin wax barrier for long-term pest and decay resistance on high-value carved species.
