Title	Modeling of Woodworkers' Exposure to Occupational Noises by Integrating Frequency Spectra Generated by Power Tools: A Pilot Study
Source type	Paper
Link / File	https://doi.org/10.3390/app10186453
Craft applicability	Wood (proposed power tools — reciprocating power chisels, rotary handpieces, angle grinders)
Primary Why-theme	8. Noise
Process stage	Proposed mechanization (Background Cutting, Outline Establishing, Jewellery making, Face finishing)
Questions answered	Why would introducing reciprocating power chisels and rotary handpieces expose the artisan to a new noise hazard not present in the current mallet-based process?
Evidence level	E3
Relevance note	Measures personal noise exposure (~80 dBA, peaks near permissible limits) from power tools including drill machines, indicating that the report's proposed power chisels and rotary tools would introduce noise exposure alongside their stated ergonomic benefits.
