Title	A Review of Wood Machining Literature with a Special Focus on Sawing
Source type	Paper (open access review)
Link / File	https://bioresources.cnr.ncsu.edu/resources/a-review-of-wood-machining-literature-with-a-special-focus-on-sawing/
Craft applicability	Wood (tool sharpness and cutting force, applies to doculi/situli/kituli blade edges)
Primary Why-theme	6. Tools and Tool-Material Interaction
Process stage	Rough finishing (motorized sharpening proposal)
Questions answered	Why does maintaining a sharp tool edge reduce the physical force required to carve wood?
Evidence level	E3
Relevance note	Confirms that cutting force is inversely proportional to tool sharpness — the sharper the tool, the lower the force required — directly supporting the report's proposal for motorized sharpening stations to reduce artisan exertion.
