Title	Reduction of Noise Pollution in CNC Wood Milling Through Multi-Parameter Optimization Using Response Surface Methodology
Source type	Paper (open access)
Link / File	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC12704844/
Craft applicability	Wood (proposed CNC micro-cutting and desktop CNC routers for batch production)
Primary Why-theme	8. Noise
Process stage	Proposed mechanization (CNC-assisted micro-cutting)
Questions answered	Why would introducing CNC routers for geometric piece cutting expose artisans to a new noise hazard exceeding safe occupational limits?
Evidence level	E3
Relevance note	Measures CNC wood milling noise pollution levels of 97.4–103.8 dB, all exceeding the NIOSH recommended limit of 85 dB, indicating that the report's proposed CNC-assisted micro-cutting for geometric pieces would introduce a significant noise exposure risk alongside its precision benefits.
