Title	Effects of Mixed Hardwoods Dust on Respiratory Function and Blood Immunoglobulin Levels in Wood Workers
Source type	Paper (open access)
Link / File	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10884841/
Craft applicability	Wood (Gamhari, Teak/Sagwan, Neem — hardwoods used in Odisha carving)
Primary Why-theme	8. Dust and Respiratory Exposure
Process stage	Block cutting, rough shaping, sanding/surface refinement
Questions answered	Why does inconsistent access to dust extraction systems pose a respiratory health risk to Odisha wood carving artisans?
Evidence level	E3
Relevance note	Measured significant reductions in lung function and elevated immunoglobulin levels among workers exposed to mixed tropical hardwood dust, directly relevant since the report flags inconsistent access to modern dust extraction systems as an unresolved challenge for artisans working with Gamhari, Teak, and Neem.
